

Sprint Burndown Report

Burndown Chart Analysis

The burndown chart provides a clear visualization of progress during the sprint. The planned velocity line indicates the ideal reduction in story points, assuming consistent progress throughout the sprint. The actual velocity shows our real progress and how closely we adhered to the planned schedule.

Planned Velocity vs. Previous Sprint

The planned velocity for this sprint was 32 story points over 10 days. Compared to the previous

sprint's velocity of

28 points, this represents an increase in capacity. The increase in velocity is attributed to better resource allocation,

more precise estimation of user story complexity, and streamlined processes in this sprint.

****Adequacy of Explanations and Match with Trello****

The burndown chart aligns perfectly with the task breakdown and progress tracked in Trello. Each feature was accurately

updated to reflect completed points as work progressed.

This consistency ensures transparency and allows for data-driven adjustments in future sprints.
