

Project: FitCoach

Sprint Duration: Nov 3 - Nov 17, 2024

Network Diagram

The visual representation of task dependencies is attached below.

Critical Path

The critical path determines the minimum time required to complete the sprint. It includes the following tasks:

1. T1: User Registration & Login Features
 2. T2: Calorie Tracking System
 3. T5: Macronutrient Calculation
 4. T6: Calorie Calculator Development
 5. T8: Demo Video & Final Adjustments
-

Strategies to Stay on Schedule

1. Daily Standups: Ensure clear communication and timely identification of blockers.
 2. Task Prioritization: Focused on critical tasks first to mitigate risks of delays.
 3. Local Hosting Decision: Avoided complexities of external hosting to save time.
 4. Collaboration Tools: Used GitHub for version control and task management.
-

What Went Wrong

- Hosting Challenges: The initial decision to attempt external hosting caused minor delays and complexity.

Switching to local hosting simplified the process but limited external testing capabilities.

- UI/UX Disagreements: Conflicts over design slowed progress, requiring additional discussions to align the team.

- Calorie Data Retrieval: Late-stage issues in accessing saved calorie data required extra debugging time.

Lessons Learned

1. Early Risk Identification: Hosting issues could have been addressed earlier with a clearer decision-making process.
2. Unified Design Vision: Aligning on UI/UX at the start would prevent mid-sprint conflicts.
